

PLC和终检ADS通信使用说明

吴敬会
2019.05.16

- ① 优点
- ② 使用范围
- ③ 框架
- ④ **Source Code**
- ⑤ 如何使用

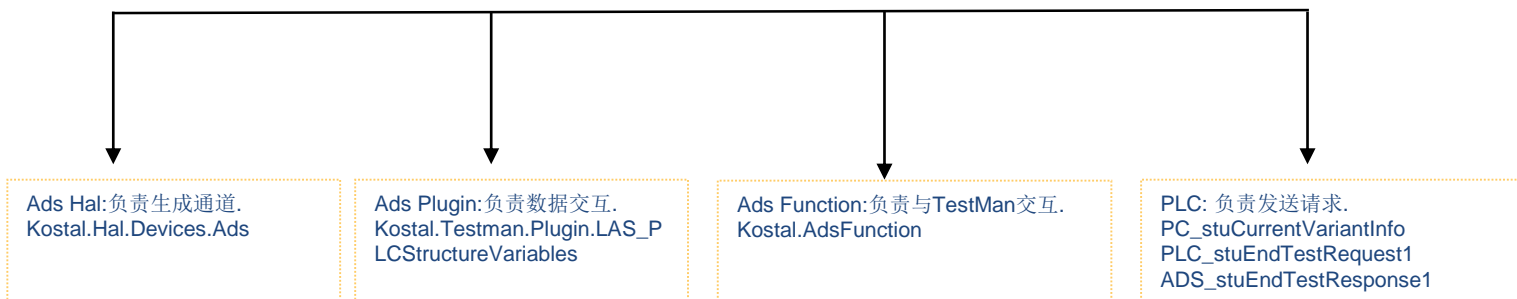

一. 优点

1. 统一的接口.
2. 统一的交互时序.
3. 减少调试时间.
4. 方便维护.

二. 适用范围

TestMan

三. 框架

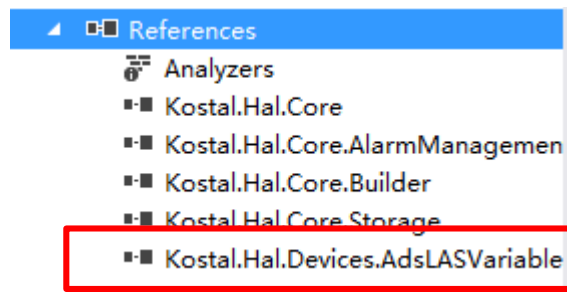

四. Source Code

1. Kostal.Hal.Devices.Ads:
<svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/Hal/Kostal.Hal.Devices.Ads>
2. Kostal.Testman.Plugin.LAS_PLCStructureVariables:
svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/Plugin/Kostal.Testman.Plugin.LAS_PLCStructureVariables
3. Kostal.AdsFunction:
<svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/others/AdsFunction/Testman4>
4. TestMan4 Example:
<svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/others/AdsFunction/Example>
5. PLC Example:
<svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/others/AdsFunction/PLC Example>

五. 如何使用

5.1 Hardware 里引用Kostal.Hal.Devices.Ads

五. 如何使用

5.2 Hardware 里新增ADS通道,详细见Demo程序

<svn://10.180.2.71/eol/Standard HW&SW/TestStand/Testman/others/AdsFunction/Example>

```
Dim channel As Channel
Dim ads_id As String = hwp.GetDeviceParameter(e, "ADS_ID")
Dim ads_port As Integer = Integer.Parse(hwp.GetDeviceParameter(e, "ADS_PORT"))

Dim m As New ChannelsContainer(Of Channel) With {.Name = e} 'VirtualModule =

Dim mods As New Kostal.Hal.Devices.AdsModule(ads_id, ads_port)
Dim ads As New Kostal.Hal.Devices.Ads(e, mods)

'add AdsRequestAction
lDeviceParameterS.Clear()
lDeviceParameterS = hwp.GetDeviceParameterS(e, "AdsRequestAction")
For Each ele In lDeviceParameterS
    channel = New AdsRequestAction(mods, "." + ele)
    channel.Name = ele
    m.Add(channel)
Next
```

5.3 Hardware 根据和PLC约定 填入变量名称

```
<parameter id="ads_id">169.254.157.201.1.1</parameter>
<parameter id="ads_port">801</parameter>
<parameter id="AdsVariantInfo">PC_stuCurrentVariantInfo</parameter>
<parameter id="AdsRequestAction">PLC_stuEndTestRequest3</parameter>
<parameter id="AdsResponseAction">ADS_stuEndTestResponse3</parameter>
```

5.4 Edit 内新增ADS Plugin

```
...TOOLS-Kostal.Testman.Plugin.T0013 \lib\plugins\plugin.T0013\Kostal.Testman.Plugin.T0013.dll)
...LAS_PLCSSTRUCTUREVARIABLES=Kostal.Testman.Plugin.LAS_PLCSstructureVariant.LAS_PLCSstructureVariables (Li
...&NAME=C:\Kostal.Testman.Plugin.T0013\lib\plugins\plugin.T0013\Kostal.Testman.Plugin.T0013.dll
```

五. 如何使用

5.5 TestMan工程里面引用Kostal.AdsFunction

VB Kostal.Testman.AdsDemo

My Project

References

Analyzers

Kostal.AdsFunction

Kostal.Common

5.6 TestApplication 定义clsLasControl 并实例化

```
Inherits Kostal.Testman.Framework.Head.Components.TestSystem
Friend PreResult As Boolean = False
Friend InitResult As Boolean = False
Friend InitOnce As Boolean = False
Private executeInit As Boolean = True
Private DemoApplication As TestApplication
Private _CurrentRefName As String
Dim alarm As New Dictionary(Of String, String)
Dim code As String = ""
Dim mes As String = ""
Private _ProcessHandler As ProcessHandler
Private iFisrtCall As Boolean = True
Private iInitResult As Boolean = True
Private clsControl As clsLasControl
Private Shared _Object As New Object

clsControl = New clsLasControl()
```

5.7 TestApplication 新增Process

* 在AddProccess函数里面

```
For Each item As clsScheduleCfg In clsControl.LasScheduleList.Values
    Select Case item.ScheduleMode
        Case ScheduleMode.ProductionMode
            Caq_Enabled = True
            Caq_TestStatus = TestStatus.Normal
        Case ScheduleMode.RetestMode
            Caq_Enabled = True
            Caq_TestStatus = TestStatus.NormalRetest
        Case ScheduleMode.AnalysisMode
            Caq_Enabled = False
            Caq_TestStatus = TestStatus.Analyse
```

五. 如何使用

5.8 TestSystem定义clsLasControl 并实例化

* 第一个参数是第几站的意思

edit里Station ID需为数字,数字等于站别

References

```
Protected Overrides Function TurningFromOffToOn(args As Kostal.Testman.Framework.Core.TurningFromOffToOnArgs) As
    clsControl = New clsLasControl(MyStation.Id, Me.Runtime)
```

```
[CELL150] Systems
  [CELL150] TEST (Test)=Kostal.Testman.AdsDemo.TestSystem (Kostal.Testman.AdsDemo.exe)
    [CELL150] MyStation: 1 (AdsDemo) = Internal Station of the system
      Parameters
      Plugins
```

5.9 TurningFromOffToOn 里面初始化Article Job选择

Me.TestApplication.Article.Select(clsControl.GetFirstArticle)

MyStation.AttachJob(clsControl.GetFirstJob)

```
clsControl = New clsLasControl(MyStation.Id, Me.Runtime)
Me.TestApplication.ShowApplicationView(ApplicationViewType.Overview)

SyncLock _Object
  Me.TestApplication.Article.Select(clsControl.GetFirstArticle)
  If MyStation.Job.Current IsNot Nothing Then
    MyStation.DetachJob()
  End If
  MyStation.AttachJob(clsControl.GetFirstJob)
  MyStation.Job.SetAttribute(ITestJobResult.PredefinedAttributeKeys.SerialNumber, "")
End SyncLock
```

五. 如何使用

5.10 ActionRequestForRun 获取启动信号和变种新增,序列号,Process cLasControl.CanStartTest(SerialNumber, ArticleSet, iJob,bArticleChange)

```

System.Threading.Thread.Sleep(200)
'Very Important, do NOT delete!!!
'-----
Dim SerialNumber As String = ""
Dim ArticleSet As ArticleConfigurationSet = Nothing
Dim iJob As Core.TestJob = Nothing
Dim bArticleChange As Boolean = False
Me.MyStation.Prompter.Set("等待中.....")
If cLasControl.CanStartTest(SerialNumber, ArticleSet, iJob, bArticleChange) Then

    SyncLock _Object
        Me.TestApplication.Article.Select(ArticleSet)
        If MyStation.Job.Current IsNot Nothing Then
            MyStation.DetachJob()
        End If
        MyStation.AttachJob(iJob)
        MyStation.Job.SetAttribute(ITestJobResult.PredefinedAttributeKeys.SerialNumber, SerialNumber)
        If bArticleChange Then
            Me.ExecuteSection(SECTION_ARTICLE_CHANGED + "ST" + MyStation.Id)
        End If
    End SyncLock
    Me.State.TurnToTest()
End If

```

5.11 TestOperation 获取Section名称

Me.ExecuteSection(cLasControl.GetSectionName + "_" + StationShortID)

References

```

Protected Overrides Function TestOperation(args As Kostal.Testman.Framework.Core.TestOperationArgs) As Kostal.Testman.Framework.Core.TestOperationResult
    Dim StationShortID As String = MyStation.Id
    Dim ret As TestingResult = TestingResult.Fail()
    ret = TestingResult.Completed(Me.ExecuteSection(cLasControl.GetSectionName + "_" + StationShortID))
    Return ret
End Function

```

Process和Section对应关系见下图.

```

Case ScheduleMode.ProductionMode
    strSection = "EOL"
Case ScheduleMode.RetestMode
    strSection = "RETEST"
Case ScheduleMode.SelfResistanceTest
    strSection = "SRT"
Case ScheduleMode.DummyTest
    strSection = "DUMMY"
Case ScheduleMode.RezCheckerTest
    strSection = "REZCHECKER"
Case ScheduleMode.MasterPartTest
    strSection = "MASTER"
Case ScheduleMode.AssemblyOnly
    strSection = "ASSM"
Case ScheduleMode.ClearMode
    strSection = "CLEAR"
Case ScheduleMode.UserDefined
    strSection = "USER"
Case ScheduleMode.StandAlone
    strSection = "STANDALONE"
Case ScheduleMode.AnalysisMode
    strSection = "ANALY"

```

五. 如何使用

5.12 TestOperationCompleted 传递结束信息至PLC

`cLasControl.SetResult(args.StationResult)`

1 reference

```
Protected Overrides Sub TestOperationCompleted(args As Kostal.Testman.Framework.Core.TestOperationCompletedArgs)
    'If args.Job.JobResult.
    Dim StationShortID As String = MyStation.Id
    cLasControl.SetResult(args.StationResult)

    Me.ExecuteSection(SECTION_POST + cLasControl.GetSectionName + "_" + StationShortID)
    Me.ExecuteSection(IIIf(args.Job.JobResult.Ok, SECTION_POST_PASS, SECTION_POST_FAIL).ToString + cLasControl.G

    MyBase.TestOperationCompleted(args)
End Sub
```
